## **Gene Linkage**

Thomas Hunt Morgan's research on fruit flies led him to the principle of linkage.

Morgan discovered that many of the more than 50 *Drosophila* genes he had identified appeared to be "linked" together.

Slide 3 of 18

They seemed to violate the principle of independent assortment.

Morgan and his associates grouped the linked genes into four linkage groups.

Each linkage group assorted independently but all the genes in one group were inherited together.

Each chromosome is actually a group of linked genes.

Slide 4 of 18 11-5 Linkage and Gene Maps 🛶 Gene Linkage

Morgan concluded that Mendel's principle of independent assortment still is true.

Slide 5 of 18

## **Gene Maps**

Crossing-over during meiosis sometimes separates genes that had been on the same chromosomes onto homologous chromosomes.

Slide 6 of 18

Crossover events occasionally separate and exchange linked genes and produce new combinations of alleles.

Alfred Sturtevant, a student of Morgan, reasoned that the farther apart two genes were, the more likely they were to be separated by a crossover in meiosis.

Recombination frequencies can be used to determine the distance between genes.

Slide 7 of 18

Sturtevant created a **gene map** showing the relative locations of each known gene on one of the *Drosophila* chromosomes.

**Copyright Pearson** 

Slide 8 of 18 If two genes are close together, the recombination frequency between them should be low, since crossovers are rare.

If they are far apart, recombination rates between them should be high.

## 11-5 Section QUIZ

Convright Pearson

Slide 12 of 18 1 According to Mendel's principle of independent assortment, the factors that assort independently are the

a. genes.

- b. chromosomes.
- c. chromatids.
- d. gametes.

A

Copyright Pearson

Slide 13 of 18

## A chromosome is actually a group of

- A independent genes.
  - b. linkage groups.
  - c. crossed-over genes.
  - d. linked genes.

Slide 14 of 18

## 11-5 Section QUIZ

- 3 Thomas H. Morgan is credited with the discovery of the principle of
  - a. segregation.
  - b. independent assortment.
  - c. gene linkage.
    - d. dominance.

A

**Copyright Pearson** 

Slide 15 of 18

- 4 Linkage maps can be produced because the farther apart two genes are on a chromosome,
  - a. the less likely they are to assort independently.
  - b. the more likely they are to be linked.
- A c. the more likely they are to be separated by a crossover.
  - d. the less likely they are to be separated by a crossover.

Slide 16 of 18

Convright Pearson

- 5 If two genes are close together on the same chromosome, they are more likely to
- A a. behave as though they are linked.
  - b. behave independently.
  - c. move to different chromosomes.
  - d. belong to different linkage groups.
